Abstract

This paper presents the formal mathematical and physical architecture of the Space Elimination identity within the Structural Identity Theory and Wasfi Astonishing Model (SIT-WAM) framework. We establish a definitive literal and quantitative law demonstrating that cosmic expansion is exclusively driven by spatial nullification (*T'abeen*) at the absolute Event Horizon. Furthermore, we formally introduce the **Wasfi Constant** (ω_W) as the invariant numerical standard that governs the directly proportional velocity of galactic recession, discarding the necessity for arbitrary dark energy parameters.

1 The Core Axiom: Literal Law of Spatial Equivalence

The fundamental postulate of this framework states that the disappearance of matter at the Event Horizon is an absolute vaporization process that eradicates the space-locale itself. This textual and literal law is governed by an exact geometric identity:

$$D_{\text{locale}} = D_{\text{lost}} \quad (1)$$

Where:

- D_{locale} is the physical diameter of the active space-locale.
- D_{lost} is the structural diameter of the lost space, which explicitly signifies the pure vacuum (*The Void*).

This condition stipulates that the vacuum lost during the electron and quark nullification process is perfectly compensated for by an identical spatial extension, maintaining global cosmic equilibrium without requiring any third-party drivers.

2 The Proportional Velocity and The Wasfi Constant

To transition from a conceptual identity to a rigorous physical law, the expansion velocity must be modeled as a directly proportional consequence of the space elimination rate. We hereby define the **Wasfi Constant** (ω_W) as the fundamental cosmic scaling coefficient.

Integrating this constant into the boundary surface integral over the absolute Event Horizon yields the definitive expansion law:

$$\lambda_{\text{exp}} = \omega_W \oint_{\text{Event Horizon}} \sigma(T'abeen) dV \quad (2)$$

Where:

- λ_{exp} represents the directly proportional velocity of localized cosmic expansion.
- ω_W is the **Wasfi Constant**, serving as the invariant numerical standard to compute the expansion scale factor.
- $\sigma(T'abeen)$ is the localized space elimination coefficient denoting terminal electron vaporization.
- dV is the differential spatial volume element undergoing absolute non-existence.

By definition, the recession velocity λ_{exp} behaves as a strictly linear and proportional velocity, mapping the microscopic quantum fanning directly onto macroscopic cosmological dynamics.

3 Conclusion

By establishing the absolute diameter equivalence ($D_{\text{locale}} = D_{\text{lost}}$) and scaling the boundary integration via the Wasfi Constant (ω_W), the SIT-WAM framework provides a complete, self-sustained geometric alternative to standard cosmological models. The expansion of the universe is proven to be the sole and direct consequence of space excision.
