

The WAM-2025 Paradigm: Decoupling of Forces & Structural Decay

Wasfi Ahmed Mohammed Al-Shhada

August 2026

Abstract

This document outlines the formal mathematical definitions of the WAM-2025 physical model, which completely decouples light energy from gravitational curvature, introducing the concept of Electron Vaporization and Local Space Expansion due to structural decay.

1 The Core Axiom: Mass-Curvature Equivalence (Law of Cuffs)

The structural curvature of space is purely an identity of mass density, completely decoupled from external energy or light:

$$\rho_m \equiv R_{str} \quad (1)$$

where ρ_m is the pure Mass Density, and R_{str} is the Structural Curvature Rate.

2 Photon Emission and The Null-State

Light intensity (I) is mathematically redefined not as an electromagnetic wave traveling through a medium, but as the direct quantum ejection of energy from electrons (ρ_e):

$$I(t) = \kappa \frac{\partial \rho_e}{\partial t} \quad (2)$$

At the event horizon of a structural well, matter reaches Maximal Singularity, and electrons undergo rapid vaporization. The cessation of electron density terminates light emission instantly:

$$\lim_{\rho_e \rightarrow 0} I(t) = 0 \quad (\text{The Null-State}) \quad (3)$$

3 Quark Pressure and Local Space Expansion

Following electron vaporization, the system relies entirely on Quark Pressure (P_q) to maintain R_{str} . The quarks undergo a slow evaporation (Structural Decay) over time t :

$$\frac{\partial \rho_q}{\partial t} = -\lambda \rho_q \implies \frac{\partial R_{str}}{\partial t} < 0 \quad (4)$$

As the structural space is cleared of mass density ($\rho_m \rightarrow 0$), the surrounding space undergoes a Local Expansion (ΔV_{space}) proportional to the loss of matter:

$$\Delta V_{space} \propto \left| \frac{\partial R_{str}}{\partial t} \right| \quad (5)$$
