

# The WAM Framework: A Structural Approach to Cosmic Dissociation and Gravitational Curvature

Wasfi Ahamad Mohamed Al-shehada

June 23, 2026

## 1 Abstract

This paper formalizes the WAM theory, proposing that the universe originates from a primordial raw mass ( $Q_{raw}$ ) that underwent a spontaneous dissociation driven by internal structural growth. We redefine spacetime not as an independent fabric, but as an emergent property of mass itself, where "Mass is the Tensor."

## 2 1. The Primordial Dissociation Equation

The Big Bang is reinterpreted as a kinetic dissociation process where the raw matter ( $Q_{raw}$ ) transforms into fractional-charged quarks ( $q_i$ ) and independent electrons ( $e^-$ ):

$$Q_{raw} \xrightarrow{E_{BB}} \sum_{i=1}^n q_i + \sum_{j=1}^m e_j^-$$

## 3 2. Defining Time and Spatial Vacancy

We define time through two distinct modes:

- **Total Time** ( $T_{total}$ ): The intrinsic duration of existence of a defined entity.
- **Circumstantial Time** ( $T_{circ}$ ): The measure of motion and event-driven interaction.

Space is defined as a **Spatial Vacancy**, an emergent state created by the movement and positioning of mass within the cosmic system.

## 4 3. The Mass-Tensor Principle

Departing from standard General Relativity, we postulate that spacetime is not a pre-existing background. Instead:

$$\text{Mass} \equiv \text{Tensor}$$

Wherever mass exists, a "curved pouch" (cuff/keffa) is generated. The curvature is not imposed upon a vacuum; it is the physical dimension of the mass's own existence. The gravitational interaction is the seek for balance between these local curvature pouches.

## 5 Conclusion

The WAM framework offers a self-contained mechanistic view of the universe, where time, space, and gravity are derivatives of the internal structural evolution of matter, eliminating the need for dark energy or pre-defined spacetime metrics.
