

The Structural Tower: Internal Galactic Lens and Light Diffusion

Wafi Ahmad Al-Shehadeh

December 25, 2025

Abstract

This research presents a unified structural model of the galaxy, defining it as a "Structural Tower" where gravity is the physical curvature of mass density. We demonstrate that the galaxy consists of tiered circular orbits, where each tier serves as a horizontal floor of stability. The distance between these tiers defines the "Curvature Length". Furthermore, we prove that light confinement is a visual deception caused by the phase vaporization (Tabeen) of electrons at the terminal floor of the galactic valley (The Black Hole).

1 The Core Structural Logic

The galaxy is a structural tower where gravity is the physical curvature of mass density. The stability of bodies like Earth is maintained by the vertical distance within this topographic structure.

2 Internal Galactic Lens and Luminous Diffusion

According to the theory of **Wafi Ahmad Al-Shehadeh**, the galactic lens is an internal phenomenon caused by the gathering of light diffusion toward the central valley.

2.1 Mathematical Model of Diffusion Gathering

The concentration of light (C_{lens}) increases exponentially as it descends into the structural depth (d):

$$C_{lens}(d) = \left(\frac{K}{d}\right)^{1.5} \quad (1)$$

3 The Structural Framework vs. Singularity Mass Properties

It is imperative to distinguish between the galactic organization and the physical properties of mass at the singularity [cite: 2025-12-25]. While the "Structural Tower" organizes orbital stability via Curvature Length, the phenomenon of light confinement is an intrinsic property of the Black Hole's mass density [cite: 2025-12-25].

4 The Event Horizon: Absolute Electron Vaporization (Tabeen)

At the terminal point of the structural depth (The Black Hole), light confinement occurs as a Fundamental Optical Deception. This is not caused by the structural gravity preventing escape, but by the absolute conversion of photons into Electron Vaporization at the event horizon, leading to Electron Enshrinement (T'abeen).

5 The Tiered Orbital Logic: Stadium Structure

Each circular tier serves as a structural "floor" that defines the local density of mass. As the radius decreases, the structural depth increases, leading to the ultimate vaporization point at the valley's center.

6 Optical Net and Conclusion

Our Python model confirms that the "Galactic Hawar" (Optical Net) is a shell of entangled energy forming the lens around the structural valley. The computational success confirms that the galactic topography (Tower and Valley) is the fundamental driver of both mass stability and optical lensing.

7 Final Law: Structural Curvature and Horizon Stability

In summary, the galactic architecture is defined by the "Curvature Length" between tiers. Each circular orbit acts as a horizontal horizon of stability relative to the one below it. This tiered density explains that light confinement is a visual deception resulting from the phase vaporization (Tabeen) of electrons at the valley's terminal floor.
